## Panel Data Regression Models

## Covered Topics

- What is Panel Data?
- Pooled Regression
- Fixed Effect Models
- Random Effect Models
- Other Panel Data Models

## What is Panel Data? (1)

- Multiple dimensioned
- Dimensions, e.g.,
-cross-section and time
-node-to-node
(c) Pongsa Pornchaiwiseskul, Faculty of Economics,

Chulalongkorn University

## What is Panel Data? (2)

Node-to-Node Example
$Y_{i j}=$ flow from node $i$ to node $j$
$\mathrm{X} 2_{\mathrm{ij}}=$ unit cost between node i and node j

## $\mathrm{X} 3_{\mathrm{ij}}=$ capacity between node i and node j

## What is Panel Data?(3)

with cross-section(i) and time $(\mathrm{t})$ indices

| $\mathbf{i}$ | $\mathbf{t}$ | $\mathbf{Y}_{\mathbf{i t}}$ | $\mathbf{X 1}_{\mathbf{i t}}$ | $\ldots$ | $\mathbf{X K}_{\mathbf{i t}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | $\mathrm{Y}_{11}$ | $\mathrm{X1}_{11}$ | $\ldots$ | $\mathrm{XK}_{11}$ |
| $:$ | $:$ | $:$ | $:$ | $\ldots$ | $:$ |
| 1 | $\mathrm{~T}_{1}$ | $\mathrm{Y}_{1 \mathrm{~T} 1}$ | $\mathrm{X}_{1 \mathrm{TI} 1}$ | $\ldots$ | $\mathrm{XK}_{1 \mathrm{~T} 1}$ |
| $:$ | $:$ | $:$ | $:$ | $\ldots$ | $:$ |
| N | I | $\mathrm{Y}_{\mathrm{N} 1}$ | $\mathrm{XI}_{\mathrm{N} 1}$ | $\ldots$ | $\mathrm{XK}_{\mathrm{N} 1}$ |
| $:$ | $:$ | $:$ | $:$ | $\ldots$ | $:$ |
| N | $\mathrm{T}_{\mathrm{N}}$ | $\mathrm{Y}_{\mathrm{NTN}}$ | $\mathrm{X} 1_{\mathrm{NTN}}$ | $\ldots$ | $\mathrm{XK}_{\mathrm{NTN}}$ |

(c) Pongsa Pornchaiwiseskul, Faculty of Economics,

## Balanced Panel Data

- Each cross-sections has equal number of time periods
or $\mathrm{T}_{1}=\mathrm{T}_{2}=\ldots=\mathrm{T}_{\mathrm{N}}$
- Simple Data Structure
- Less complicated computation

## Linear Model for Panel Data (1) <br> $Y_{i t}=\beta_{1 i t} X_{1 i t}+\beta_{2 i t} X_{2 i t}+\ldots+\beta_{K i t} X_{K i t}+\varepsilon_{i t}$

- beta coefficients could be
time-invariant: $\quad \beta_{k i t}=\beta_{k i}$ for $\forall t$ section-invariant: $\beta_{k i t}=\beta_{k t}$ for $\forall i$ both :

$$
\beta_{k i t}=\beta_{k} \text { for } \forall i, t
$$

# Linear Model for Panel Data (2) 

- variance of error terms could be
time-invariant : $\quad V\left(\varepsilon_{i t}\right)=\sigma_{i}^{2}$ for $\forall t$ section-invariant: $V\left(\varepsilon_{i t}\right)=\sigma_{t}^{2}$ for $\forall i$ both :

$$
V\left(\varepsilon_{i t}\right)=\sigma^{2} \text { for } \forall i, t
$$

## Pooled Regression (1)

General Assumption:
$Y_{i t}=\beta_{1} X_{1 i t}+\beta_{2} X_{2 i t}+\ldots+\beta_{K} X_{K i t}+\varepsilon_{i t}$ where

1) all the $\beta$ coefficients are both time and cross-sectional invariant

## Pooled Regression (2)

2) homoscedastic error terms

$$
V\left(\varepsilon_{i t}\right)=\sigma^{2} \text { for all } i, t
$$

or it is also time-invariant and section-invariant
=> OLS applies.

## Pooled Regression (2)

| $\mathbf{i}$ | $\mathbf{t}$ | $\mathbf{Y}_{\mathbf{i t}}$ | $\mathbf{X 1}_{\mathbf{i t}}$ | $\ldots$ | $\mathbf{X K}_{\mathbf{i t}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | $\mathrm{Y}_{11}$ | $\mathrm{XI}_{11}$ | $\ldots$ | $\mathrm{XK}_{11}$ |
| 1 | 2 | $\mathrm{Y}_{12}$ | $\mathrm{X}_{12}$ | $\ldots$ | $\mathrm{XK}_{12}$ |
| $:$ | $:$ | $:$ | $:$ | $\ldots$ | $:$ |
| 1 | T | $\mathrm{Y}_{1 \mathrm{~T}}$ | $\mathrm{X}_{1 \mathrm{~T}}$ | $\ldots$ | $\mathrm{XK}_{1 \mathrm{~T}}$ |
| $:$ | $:$ | $\dot{\mathrm{Y}}$ | $:$ |  | $:$ |
| N | I | $\mathrm{Y}_{\mathrm{N} 1}$ | $\mathrm{XI}_{\mathrm{N} 1}$ | $\ldots$ | $\mathrm{XK}_{\mathrm{N} 1}$ |
| N | 2 | $\mathrm{Y}_{\mathrm{N} 2}$ | $\mathrm{X}_{\mathrm{N} 2}$ | $\ldots$ | $\mathrm{XK}_{\mathrm{N} 2}$ |
| $:$ | $:$ | $:$ | $:$ | $\ldots$ | $:$ |
| N | T | $\mathrm{Y}_{\mathrm{NT}}$ | $\mathrm{X} 1_{\mathrm{NT}}$ | $\ldots$. | $\mathrm{XK}_{\mathrm{NT}}$ |

## Fixed Effect Models (1)

Also called LS Dummy Variable
(LSDV) Model. $\mathrm{X}_{1}$ is constant.
$Y_{i t}=\beta_{1 i}+\beta_{2} X_{2 i t}+\ldots+\beta_{K} X_{K i t}+\varepsilon_{i t}$

1) all the $\beta$ coefficients are timeinvariant and cross-sectional invariant except that $\beta_{1}$ is sectionvariant but time-invariant

## Fixed Effect Models (2)

2) homoscedastic error terms

$$
V\left(\varepsilon_{i t}\right)=\sigma^{2} \text { for all } i, t
$$

or it is time-invariant and sectioninvariant

## $=>$ OLS applies if dummy variables are introduced.

## Fixed Effect Models (3)

Equivalent LSDV

$$
\begin{aligned}
& Y_{i t}= \beta_{11} D_{1 i t}+\beta_{12} D_{2 i t}+\ldots+\beta_{1 N} D_{\text {Nit }} \\
&+\beta_{2} X_{2 i t}+\ldots+\beta_{K} X_{K i t}+\varepsilon_{i t} \\
& \text { where }
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{D}_{\mathrm{jit}} & =1 \text { if } \mathrm{i}=\mathrm{j}, \mathrm{j}=1, \ldots, \mathrm{~N} \\
& =0 \text { otherwise }
\end{aligned}
$$

Note that
$\mathrm{D}_{1 \mathrm{it}}+\mathrm{D}_{2 \mathrm{it}}+\ldots+\mathrm{D}_{\mathrm{Nit}}=1$ for all $\mathrm{i}, \mathrm{t}$

## Fixed Effect Models (4)

| $\mathbf{i}$ | $\mathbf{t}$ | $\mathbf{Y}_{\mathbf{i t}}$ | $\mathbf{D}_{\mathbf{1 i t}}$ | $\ldots$ | $\mathbf{D}_{\text {Nit }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | $\mathrm{Y}_{11}$ | 1 | $\ldots$ | 0 |
| $:$ | $:$ | $:$ | $:$ | $\ldots$ | $:$ |
| 1 | $\mathrm{~T}_{1}$ | $\mathrm{Y}_{1 \mathrm{~T} 1}$ | 1 | $\ldots$ | 0 |
| $:$ | $:$ | $:$ | $:$ |  | $:$ |
| N | 1 | $\mathrm{Y}_{\mathrm{N} 1}$ | 0 | $\ldots$ | 1 |
| $:$ | $:$ | $:$ | $:$ | $\ldots$ | $:$ |
| N | $\mathrm{T}_{\mathrm{N}}$ | $\mathrm{Y}_{\mathrm{NTN}}$ | 0 | $\ldots$ | 1 |

## Fixed Effect Models (5)

Alternative form of FEM

$$
Y_{i t}=\beta_{1 t}+\beta_{2} X_{2 i t}+\ldots+\beta_{K} X_{K i t}+\varepsilon_{i t}
$$

Note that $\beta_{1}$ is time-variant but section-invariant, instead Equivalent LSDV for this FEM is as follows:

## Fixed Effect Models (6)

Equivalent LSDV

$$
\begin{aligned}
Y_{i t}= & \beta_{11} D_{1 i t}+\beta_{11} D_{2 i t}+\ldots+\beta_{1 T} D_{T i t} \\
& +\beta_{2} X_{2 i t}+\ldots+\beta_{K} X_{K i t}+\varepsilon_{i t}
\end{aligned}
$$

where

$$
\begin{aligned}
\mathrm{D}_{\mathrm{jit}} & =1 \text { if } \mathrm{t}=\mathrm{j}, \mathrm{j}=1, \ldots, \mathrm{~T} \\
& =0 \text { otherwise }
\end{aligned}
$$

Note that

## Fixed Effect Models (7)

## Common Problems

- many dummy variables required
- multi-collinearity problem likely
- interpretation of variant coefficients
- What if error terms are heteroscedastic?

## Fixed Effect Models (8)

Heteroscedasticity
-cross-section weight

$$
V\left(\varepsilon_{i t}\right)=\sigma_{i}^{2} \text { for } \forall \mathrm{t}
$$

-time weight

$$
\begin{aligned}
& \qquad V\left(\varepsilon_{i t}\right)=\sigma_{t}^{2} \text { for } \forall \mathrm{i} \\
& =>\mathrm{WLS} \text { applies }
\end{aligned}
$$

## Fixed Effect Models (9)

## Heteroscedasticity

-cross-section covarince

$$
\operatorname{COV}\left(\varepsilon_{i t}, \varepsilon_{j t}\right)=\sigma_{i j}=\sigma_{j i} \text { for } \forall \mathrm{t}
$$

-auto-correlation

$$
\begin{aligned}
& \quad \operatorname{COV}\left(\varepsilon_{i s}, \varepsilon_{i t}\right)=\sigma_{s t}=\sigma_{t s} \text { for } \forall \mathrm{i} \\
& =>\text { FGLS applies }
\end{aligned}
$$

## Random Effect Models (1)

 or REM for short. Also known as Error Component Models (ECM). $\mathrm{X}_{1}$ is also constant.$Y_{i t}=\beta_{1 i}+\beta_{2} X_{2 i t}+\ldots+\beta_{K} X_{K i t}+\varepsilon_{i t}$
Similar to FEM except that
$\beta_{1 \mathrm{i}}=\beta_{1}+\xi_{\mathrm{i}}$
where $\xi_{\mathrm{i}}$ is cross-sectional variation

## Random Effect Models (2)

Case $1 \mathrm{~V}\left(\xi_{\mathrm{i}}\right)$ is section-invariant and $\mathrm{C}\left(\varepsilon_{\mathrm{it}} \xi_{\mathrm{i}}\right)$ is invariant

$$
\begin{aligned}
& Y_{i t}=\beta_{1}+\beta_{2} X_{2 i t}+\ldots+\beta_{K} X_{K i t}+\varepsilon_{i t}^{\prime} \\
& \text { where } \varepsilon_{i t}^{\prime}=\varepsilon_{i t}+\xi_{i}
\end{aligned}
$$

## Random Effect Models (3)

Note that
$\mathrm{V}\left(\varepsilon_{i t}^{\prime}\right)=\mathrm{V}\left(\varepsilon_{i t}\right)+\mathrm{V}\left(\xi_{i}\right)+2 C\left(\varepsilon_{i t}, \xi_{i}\right)$
$\mathrm{V}\left(\varepsilon_{i t}^{\prime}\right)$ is invariant.

## $=>$ OLS applies. Trivial.

# Random Effect Models (4) 

 Case $2 \mathrm{~V}\left(\xi_{\mathrm{i}}\right)$ is section-variant and/or $\mathrm{C}\left(\varepsilon_{\mathrm{it}} \xi_{\mathrm{i}}\right)$ is section-variant Note that $\mathrm{V}\left(\varepsilon_{i t}^{\prime}\right)$ is section-variant.Error term is heteroscedastic => FGLS applies. How?

$$
V\left(\varepsilon^{\prime}\right)=\left[\begin{array}{ccc:ccc:ccc}
\sigma_{1}^{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & \ddots & 0 & 0 & \ddots & 0 & 0 & \ddots & 0 \\
0 & 0 & \sigma_{1}^{2} & 0 & 0 & 0 & 0 & 0 & 0 \\
\hdashline 0 & 0 & 0 & \ddots & 0 & 0 & 0 & 0 & 0 \\
0 & \ddots & 0 & 0 & \ddots & 0 & 0 & \ddots & 0 \\
0 & 0 & 0 & 0 & 0 & \ddots & 0 & 0 & 0 \\
\hdashline 0 & 0 & 0 & 0 & 0 & 0 & \sigma_{N}^{2} & 0 & 0 \\
0 & \ddots & 0 & 0 & \ddots & 0 & 0 & \ddots & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_{N}^{2}
\end{array}\right]
$$

# Random Effect Models (5) 

Case $3 \mathrm{~V}\left(\xi_{\mathrm{i}}\right)$ is section-variant and/or $\mathrm{C}\left(\varepsilon_{\mathrm{iti}} \xi_{\mathrm{j}}\right)$ is section-variant but $\varepsilon_{i t}=\varepsilon_{i}$
Note that $\mathrm{V}\left(\varepsilon_{i t}^{\prime}\right)$ is section - variant.
Error term is general
$=>$ FGLS applies. How?

$$
V\left(\varepsilon^{\prime}\right)=\left[\begin{array}{ccc:ccc:ccc}
\sigma_{1}^{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & \ddots & 0 & 0 & \ddots & 0 & 0 & \ddots & 0 \\
0 & 0 & \sigma_{1}^{2} & 0 & 0 & 0 & 0 & 0 & 0 \\
\hdashline 0 & 0 & 0 & \ddots & 0 & 0 & 0 & 0 & 0 \\
0 & \ddots & 0 & 0 & \ddots & 0 & 0 & \ddots & 0 \\
0 & 0 & 0 & 0 & 0 & \ddots & 0 & 0 & 0 \\
\hdashline 0 & 0 & 0 & 0 & 0 & 0 & \sigma_{N}^{2} & 0 & 0 \\
0 & \ddots & 0 & 0 & \ddots & 0 & 0 & \ddots & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_{N}^{2}
\end{array}\right]
$$

## FEM vs REM (1)

They are substitute if no theoretical preference. Note that

1) FEM is preferred when $T$ is large and N is small.
2) T is small but N is large. Degree of freedom for FEM is small.
REM is more efficient.

## FEM vs REM (2)

3) For $T$ is small and $N$ is large,

FEM is preferred if crosssectional variation $\left(\xi_{\mathrm{i}}\right)$ is nonrandom. Otherwise, REM is preferred.

## FEM vs REM (3)

4) $\xi_{i}$ and $X_{\text {kit }}$ are correlated. FEM yields unbiased estimator but REM yields biased estimator

## Cross-sectional Heteroscedasticity (1)

$$
Y_{i t}=\beta_{1 i}+\beta_{2 i} X_{2 i t}+\ldots+\beta_{K i} X_{K i t}+\varepsilon_{i t}
$$

Assume time-invariant variancecovarinace for error terms.
In addition to possibility of different cross-section weights (variances), covariances between errors of cross sections could be non-zero.

## Cross-sectional Heteroscedasticity (2)

$$
\begin{aligned}
& \mathrm{V}\left(\varepsilon_{\mathrm{it}}\right)=\sigma_{\mathrm{j}}^{2} \\
& \operatorname{Cov}\left(\varepsilon_{\mathrm{it}}, \varepsilon_{\mathrm{j} t}\right)=\sigma_{\mathrm{ij}} \text { for all t }
\end{aligned}
$$

or they are time-invariant but sectionvariant
=> WLS will not applies as there are non-zero covariances between observation. Need GLS or FGLS.
